

GROUP 5 – WEBSITE PROJECT

Client: Saffron Digital Trust

Client Representative: Ayaan Farooq

Client Location: United Arab Emirates

Estimated Completion Time: 23 days

About the Company:

Saffron Digital Trust works with organizations that require absolute certainty around digital document authenticity. Their clients include legal firms, financial institutions, and compliance bodies that rely heavily on digital records during audits and disputes.

Project Description (Client's Perspective):

Ayaan explained that their biggest challenge is not document storage, but proof. When disputes arise, they must demonstrate exactly when a document was uploaded, who accessed it, and whether it was altered. Existing tools lack reliable audit trails or can be manipulated.

The client wants a secure internal website that treats documents as digital evidence. Every interaction must be logged immutably, and integrity must be provable at any point in time. The platform should be minimal, serious, and focused entirely on trust and traceability.

Frontend Requirements:

The frontend should be clean and minimal, focusing on document status, access history, and verification results. Users should be able to view document timelines and audit trails clearly without unnecessary distractions.

Backend Requirements:

The backend should manage document storage, cryptographic hashing, and access logs. A machine learning classification model can be used to detect unusual access behavior, while a deep learning-based pattern model can identify suspicious access sequences over time. Strong access control and immutable logging are mandatory.
